SUMMARY

This document presents the S-IB stage steering program and the Iterative Guidance Mode (IGM) presettings for the AS-206A Mission. In addition, the associated AS-206A Preliminary Launch Vehicle Operational Trajectory and a summary of the SA-206 Launch Vehicle performance characteristics are presented for review and critique.

The S-IB stage tilt program was derived to provide a near zero angle of attack history throughout the high dynamic pressure region of flight assuming a zero wind profile. However, the AS-206A Preliminary L/V Operational Trajectory was generated using a mean April head/tail wind profile. A summary of the end conditions of flight are presented below:

	<u>S-IB/S-IVB Separation</u>	<u>S-IVB Guidance Cutoff Signal</u>
Flight Time (sec)	143.34	580.46
Altitude (km)	61.18	163.19
Space Fixed Velocity (m/s)	2462.50	7821.99
Space Fixed Path Angle (deg)	66.35	90.00
Space Fixed Flight Azimuth (deg)	75.46	85.54
Longitude-Positive West (deg)	79.88	62.48
Geodetic Latitude (deg)	28.73	31.50

The nominal SA-206 Launch Vehicle weight in orbit capability is predicted to be 6,857 pounds in excess of the propellant depletion weight. Based on an FPR of 1,330 pounds, approximately 5,527 pounds of S-IVB propellant can be allocated for an inflight alternate mission.

SECTION 1

INTRODUCTION

1.1 MISSION DESCRIPTION: The basic purpose of the Apollo-Saturn 206A Mission is to launch and test a complete, fully loaded LEM for verification of LEM subsystems operation and LEM staging fire-in-the-hole abort capability. The primary objective of the SA-206 Launch Vehicle is to insert the S-IVB/IU/Payload configuration in a near earth 85/120 nautical mile elliptical orbit. The payload consists of a Lunar Excursion Module (LEM), Special LEM Adapter (SLA), and a 25° Nose Cone. (See References 1, 2, and 13.)

The preplanned alternate mission for the AS-206 Mission is to perform a dual AS-206/207 launch. The inflight alternate mission capability during S-IB stage powered flight is for one engine out. The alternate mission is then seven engine S-IB burn, S-IVB burn and LEM DPS burn to orbit. The inflight alternate mission during S-IVB stage powered flight is for loss of thrust. The alternate mission is then LEM DPS burn to orbit. (See Reference 1.)

1.2 VEHICLE AND ENVIRONMENT DESCRIPTION: The SA-206 Launch Vehicle, for the purpose of this analysis, is defined by the subsystem characteristics and data in References 4 and 7-11. A summary of the data is presented in Appendix A. Revisions and updates will be incorporated in the AS-206A Launch Vehicle Operational Flight Trajectory.

The atmospheric properties incorporated in the trajectory simulations are as defined by the 1963 Patrick Reference Atmosphere. The Fischer earth model and potential function are utilized.

The April mean head/tail wind profiles defined in References 5 and 6 are included in the Preliminary L/V Operational Trajectory simulation.

1.3 TRAJECTORY GROUNDRULES: The following mission criteria, trajectory constraints, and vehicle constraints have been imposed on the SA-206 Launch Vehicle trajectory: (a) Launch from AFETR Pad 37B; (b) Launch azimuth (fin 1/pad orientation) 90 degrees east of North; (c) Flight azimuth 72 degrees east of North; (d) Orbit insertion conditions for an 85/120 nautical mile elliptical orbit; (e) One degree per second limit on commanded vehicle attitude rates.

SECTION 2

DISCUSSION

2.1 PRELIMINARY LAUNCH VEHICLE OPERATIONAL TRAJECTORY: The AS-206A Preliminary L/V Operational Trajectory presented herein was generated using the guidance presettings presented in Tables 1-3. The SA-206 vehicle flight sequence of events and weight statement are summarized in Tables 4 and 5, respectively. The sequence of events is consistent with the propulsion data in Reference 7, the J-2 engine firing sequence in References 8 and 9, and the vehicle mass data defined in Reference 10. The weight statement is consistent with the referenced mass data and the L/V trajectory defined herein.

In order to establish a more realistic nominal trajectory prediction, a constant force bias equal to + 0.7 per cent of the vehicle sea level longitudinal thrust has been included in the S-IB stage trajectory. This action is an attempt to minimize the effects of an apparent systematic shift in the ground to flight test performance level. (See Reference 4.) In addition, the L/V trajectory simulation incorporated the April mean head/tail wind profile defined in References 5 and 6.

Summaries of the S-IB and S-IVB stage end conditions of flight are given in Tables 6 and 7. Tabular listings of pertinent L/V trajectory parameters, in metric units, are given in Tables 8 and 9 for the S-IB and S-IVB stages of powered flight, respectively. The corresponding listings for English units are given in Tables 10 and 11. Figures 1 and 2 depict the S-IB stage tilt program and the resulting vehicle pitch attitude rate history. The S-IVB stage pitch and yaw attitude steering histories are depicted in Figures 3 and 4. Flight time histories of the S-IB stage angle of attack and dynamic pressure are presented in Figures 5 and 6. Figures 7 and 8 present trajectory parameter histories pertinent to an analysis of the phase of flight from S-IB/S-IVB separation to IGM initiation.

A comparison of pertinent trajectory parameters from the Preliminary L/V Operational Trajectory with those of the two previously published Reference Trajectories is given in Table 12.

The coordinate systems for the trajectory data presented herein are consistent with the Project Apollo Coordinate Systems Standards defined in Reference 12.

2.2 GUIDANCE AND CONTROL: Guidance of the SA-206 Launch Vehicle is separated into the following three guidance modes:

- 1) Pre-IGM: An open loop guidance mode in the sense that the steering commands are prespecified functions of time.
- 2) IGM: An active closed loop guidance mode with the steering commands provided by a two-stage, three-dimensional formulation of the Iterative Guidance Mode (IGM).

- 3) Orbital: An active guidance mode during the S-IVB/IU orbital phases of flight in which a series of vehicle attitude maneuvers are executed.

The Pre-IGM guidance mode provides pitch, yaw, and roll attitude angle steering commands from liftoff through the S-IB stage powered phases of flight and the S-IVB stage phases of flight subsequent to IGM initiation. The Pre-IGM guidance mode is divided into five consecutive time segments. During each time segment the pitch attitude steering angle is obtained as a function of time using a third degree polynomial. The flight time segments, the yaw and roll commands, and the polynomial coefficients derived for the AS-206A Mission are delineated in Table 1. Derivation of the S-IB stage guidance presettings is discussed in subsequent paragraphs.

The IGM guidance mode is initiated approximately 3 seconds after jettisoning the ullage rocket cases. The IGM provides pitch and yaw attitude angle steering commands throughout the S-IVB stage phases of powered flight to the time of orbital insertion. The commanded roll attitude angle is zero. The IGM equations and logic for the SA-206 LVDC Flight Program are defined in Reference 3. The set of IGM presettings derived for the AS-206A Mission is presented in Table 3.

The orbital guidance mode provides pitch, yaw and roll attitude commands for the prespecified L/V maneuvers planned for the orbital phase of the AS-206A Mission. (See Reference 3.)

During the S-IB stage of powered flight, vehicle pitch, yaw, and roll control are maintained by the four outboard H-1 engines. During the S-IVB phases of powered flight, pitch and yaw attitude control are maintained by the J-2 engine with roll attitude control provided by the Auxiliary Propulsion System (APS). Pitch, yaw, and roll attitude control are maintained by the APS during the orbital phases of S-IVB/IU flight. (See Reference 11.)

2.3 S-IB STAGE PITCH PROGRAM: A trajectory simulation technique which commands a prespecified vehicle pitch angle of attack (α_p) history throughout the S-IB stage of flight was utilized to shape the S-IB stage tilt program. It is noted that all trajectory simulations incorporated the vehicle data referenced herein and the guidance and control modes discussed above. A family of launch vehicle trajectories was generated in the absence of any wind profile for a series of α_p histories. From this family, the trajectory which collectively best satisfied each of the following criteria was chosen:

- 1) S-IB/S-IVB Stage Separation Conditions:
Dynamic Pressure: $\leq 75 \text{ kg/m}^2$
Pitch Angle of Attack: $\sim -0.5 \text{ deg.}$
Vehicle Attitude Rate: $\sim 0. \text{ deg/sec.}$
- 2) Near zero pitch angle of attack throughout the high dynamic pressure region of flight.

- 3) Commanded vehicle attitude rates less than one degree per second.
- 4) Aerodynamic Heating:
Aerodynamic heating indicator (AHI) at S-IB staging comparable to the Reference Trajectory value.

$$AHI = \int_{\pi/2 - |\alpha|}^{\alpha} \frac{q V_R}{dt} \left(\frac{kg \cdot m}{m^2 \cdot rad} \right)$$

- 5) L/V Weight in Orbit Capability:
Useable S-IVB propellant of at least 1500 pounds referenced to the S-IVB stage propellant data in Reference 10.

From the selected trajectory, the commanded pitch attitude angle data were fitted to a third degree polynomial, for three time intervals, using the method of least squares. The selected tilt program coefficients and the corresponding time interval for the LVDC Flight Program are presented in Table 1.

Table 2 presents a time history of the pitch attitude command (X_c) to the control system subroutine utilized in the trajectory simulation program. The L/V trajectory profile and the data in Table 2 are a result of simulating the X_y polynomial in Table 1 as follows:

$$X_y = f(T)$$

where

$$T = t - T_1 + NGMDT$$

with

t = time from GRR

T_1 = time base # 1. (0.2 second after first motion; $T_1 = 5.2$ sec.)

NGMDT = 1. sec. (Approximation of LVDC major loop cycle time.)

The pitch attitude command (X_c) to the control system subroutine was then implemented using a pitch attitude angle rate derived from successive values of X_y .

2.4 IGM PRESETTINGS: A set of IGM presettings for the AS-206A Mission was derived for the AS-206 Launch Vehicle and is presented in Table 3. The terminology used to define the IGM parameters is consistent with Reference 3. It is noted that the IGM presettings are strongly dependent on the proposed flight sequence of events and the S-IVB stage propulsion characteristics defined for the SA-206 Launch Vehicle. If these data change significantly prior to flight, then the presettings are subject to change. A review of the presettings will be made concurrently with generation of the AS-206A Launch Vehicle Operational Trajectory.

An investigation of the L/V orbital plane targeting conditions is summarized in Figures 9 and 10. The orbital plane targeting conditions determined for the Reference Trajectory

Argument of Descending Node (θ_N): 119.0548 (deg)

Inclination (i): 31.6143 (deg)

were used as the base point for the data presented in Figure 9. It is noted that the Reference Trajectory values yield a near optimum L/V weight in orbit capability for the SA-206 vehicle considered herein. Therefore, from a performance standpoint the above IGM parameters are applicable for the Preliminary L/V Operational Trajectory. Figure 10 depicts the vehicle yaw attitude angle history for the family of S-IVB stage trajectories considered. It is concluded that the Reference Trajectory targeting parameters provide a more desirable vehicle yaw attitude angle flight history.

SECTION 3

RESULTS

An examination of the AS-206A Preliminary L/V Operational Trajectory reveals that the S-IB stage tilt program and IGM presettings presented herein satisfy the stated mission objectives and vehicle constraints. The S-IB stage tilt program was shaped to provide a near zero angle of attack profile through the maximum dynamic pressure region of flight. However, the predicted nominal S-IB stage flight trajectory was generated using a mean April head/tail wind profile. The resulting angle of attack profile depicted in Figure 5 is deemed acceptable. It is noted that the IGM presettings are uniquely related to the S-IVB stage propulsion system characteristics defined for this analysis. If these data change significantly prior to flight, the IGM presettings presented herein are subject to change.

Table 12 presents a convenient comparison of the AS-206A Preliminary L/V Operational Trajectory with the two previously published Reference Trajectories. The revised Reference Trajectory reflects the substitution of a 25° nose cone for the boilerplate Apollo CSM and incorporation of a three second interval between inboard and outboard engines cutoff. This configuration is consistent with the L/V trajectory documented herein. It is noted that the Preliminary L/V Operational Trajectory aerodynamic heating indicator (AHI) is approximately 8.5% less than the revised Reference Trajectory.

The SA-206 Launch Vehicle performance capability is summarized in Table 5. It is noted that for the nominal predicted flight approximately 6,857 pounds of S-IVB stage burnable propellants remain in the tanks. Reference trajectory analyses indicate that the FPR requirement for the AS-206A Mission will be approximately 1,330 pounds. Hence, approximately 5,527 pounds of propellants can be allocated for an inflight alternate mission, i.e., early S-IB stage engine out.
